PUSD on BCH

A PUSD budget the BCH VM can enforce

Per-period limits for people and AI agents

streamvault-cash.vercel.app

The trust gap

An AI agent with a wallet can spend everything it can reach.

A cap in a prompt is not a financial control.

Custody adds a party that can freeze funds or lose the key.

The covenant is the control

PUSD stays on chain. The payee gets one tranche per period. The payer keeps a cancel key and can reclaim the remainder.

One covenant, three users

01 Sponsor locks PUSD and keeps cancel control

02 Worker claims one tranche per period

03 Agent claims a small budget and pays a service per request

Same primitive: claim(), cancel(), amountPerPeriod and periodBlocks.

Limits enforced by the BCH VM

claim() requires one vault input and two outputs

this.age gates the next tranche

token category and amount conserve PUSD

only cancel() can empty the vault

Why BCH

Sub-cent settlement makes $0.01 service calls practical
CashTokens conserve PUSD on chain
Relative timelocks enforce the period
WizardConnect keeps keys in the user wallet
Business: hosted budget console, provider SDK and agent billing gateway. No protocol fee.

StreamVault.cash

Give an AI an allowance, not your bank account.
